

RETROFITTING – CREATE A FULLY AUTOMATED HOME WITHOUT MAJOR UPHEAVAL

Install Automation have a solution for those who want the ease of an automated home but do not want the hassle of installing new cables and risking damage to the property.

Often, people associate home automation with new builds and complete renovation, but this is changing as retrofitting is now possible and very simple to implement. Wireless music systems are readily available and easily installed. The best news is that installing a structured wiring system is no more difficult or disruptive than putting in an alarm system.

High Definition television can be distributed to many rooms in the house from one receiver and controlled from one place using a number of methods to suit the user. Install Automation's new iPhone application and interface is one option. There is now no need to have touch panels and remotes to control the home automation system, it can all be done from the users iPhone.

“With so many people deciding to renovate rather than self-build at the moment, we are very excited about the possibilities that this technology brings,” said Adam Kent, Managing Director of Install Automation. “There isn't a better time to retrofit and add value to your home.”

Install Automation is now in its 10th year of providing customers with tailored home automation solutions. Typical projects range from a single cinema room to a 30,000 sq ft residential build.
